435/320.1

ABSTRACT:

The functional analysis of genes frequently requires the manipulation of large genomic regions. A yeast-bacteria shuttle vector is described, that can be used to clone large regions of DNA by homologous recombination. The important feature of present invention is the presence of the a bacterial replication origin, which allows large DNA insert capacity. The utility of this vector lies in its ability to isolate, manipulate and maintain large fragments in bacteria and yeast, allowing for mutagenesis by yeast genetics and simplified preparation of plasmid DNA in bacteria.

536/24.31, 536/24.32, 536/24.33

ABSTRACT:

The present invention provides methods for construction of recombinant Yeast Artificial Chromosomes ("YAC") by homologous recombination between YACs during meiosis. In particular, conditions are provided for the step of mating haploid cells and for the step of spore analysis that increase the frequency of spores containing the desired recombinant YAC. The methods find particular use in constructing recombinant YACs between YACs that are incompatible when co-propagated in a diploid and/or that share homology regions of less than about 50 kilobases. Linking YACs, methods of their construction, and methods of their use are provided that allow facile construction of a YAC containing two or more discontinuous regions of DNA.

435/91.4, 435/91.41, 536/23.1

ABSTRACT:

A method for producing infectious recombinant baculoviruses in bacteria is described. A novel baculovirus shuttle vector (bacmid) was constructed that contains a low-copy-number bacterial replicon, a selectable drug resistance marker, and a preferred attachment site for a site-specific bacterial transposon, inserted into a nonessential locus of the baculovirus genome. This shuttle vector can replicate in *E. coli* as a plasmid and is stably inherited and structurally stable after many generations of growth. Bacmid DNA isolated from *E. coli* is infectious when introduced into susceptible lepidopteran insect cells. DNA segments containing a viral promoter driving expression of a foreign gene in insect cells that are flanked by the left and right ends of the site-specific transposon can transpose to the attachment site in the bacmid propagated in *E. coli* when transposition functions are provided in trans by a helper plasmid. The foreign gene is expressed when the resulting composite bacmid is introduced into insect cells.

ABSTRACTED-PUB-NO: US 5792632A
BASIC-ABSTRACT:

A method to induce at least 1 site-directed double strand (ds) break in a cell's DNA comprises: (a) providing cells contg. ds DNA including at least 1 I-SceI restriction site; (b) transfecting the cells with at least a plasmid comprising DNA encoding the I-SceI meganuclease; and (c) selecting cells in which at least 1 ds break has been induced.

USE - The method is useful to induce homologous recombination between a cell's, pref. a stem cell, chromosomal DNA and exogenous DNA, esp. to insert DNA encoding polypeptides (claimed). By transforming stem cells with the DNAs, polypeptides can be expressed in transgenic animals. Cells and transgenic animals contg. an inserted I-SceI site at a predetermined location are useful for screening procedures, e.g. for phenotypes, ligands and drugs, and for very high level reproducible expression of recombinant retroviral vectors if the cell line is a transcomplementing cell line for retrovirus prodn. Transfected cells, e.g. haematopoietic tissue or skin cells, can be used as targets for gene therapy.

ABSTRACT:

This invention relates to a method of constructing a villin gene hybrid by inserting an I-Sce I restriction site next to or within a gene or cDNA encoding a villin protein. The insertion site of the I-Sce I restriction site is chosen as to provide a first downstream part and a second upstream part from the site, containing at least twelve nucleotides of the gene or cDNA encoding the villin protein. Furthermore, the insertion of the restriction permits a high frequency of homologous recombination events. The villin gene hybrid may be used to transfect eukaryotic cells, and particularly, embryonic stem cells.
